

10 new facts about solar system

Our universe is full of mysterious sights, and spine-tingling sounds. Take a journey to the most frightful corners of the cosmos. Top 10 Sinister Solar System Facts. Haunted Hayride through the Sinister Solar System.

Dwarf planet Pluto is a member of a group of objects that orbit in a disc-like zone beyond the orbit of Neptune called the Kuiper Belt. This distant realm is populated with thousands of miniature icy worlds, which formed early in the history of our solar system about 4.5 billion years ago.

Here are 10 facts about the Pioneers. 1. Before Voyager. Voyager, with its outer solar system tour and interstellar observations, is often credited as the greatest robotic space mission. But the plucky Pioneers proved Voyager's epic mission was possible. An illustration of Pioneer 10 at Jupiter. 2.

Dawn is the only mission to orbit two deep-space destinations. Enabled by the exceptional efficiency of ion propulsion, Dawn became the first spacecraft to orbit two deep-space bodies. This is an exciting engineering feat, demonstrating the ...

A planet is a celestial body that (a) is in orbit around the Sun, (b) has sufficient mass for its self-gravity to overcome rigid body forces so that it assumes a hydrostatic equilibrium (nearly round) shape, and (c) has cleared the neighbourhood around its orbit.

Our solar system's small bodies - asteroids, comets, and meteors - pack big surprises. These chunks of rock, ice, and metal are leftovers from the formation of our solar system 4.6 billion years ago. They are a lot like a fossil record of our early solar system.

While Earth is only the fifth largest planet in the solar system, it is the only world in our solar system with liquid water on the surface. Just slightly larger than nearby Venus, Earth is the biggest of the four planets closest to the Sun, all of which are made of rock and metal.

The Sun is the largest object in our solar system. Its diameter is about 865,000 miles (1.4 million kilometers). Its gravity holds the solar system together, keeping everything from the biggest planets to the smallest bits of debris in orbit around it.

New missions and new milestones are on the calendar for 2021. Here are some of the things to watch for in planetary science, as we continue to explore and learn about our incredible solar system.

Our solar system consists of our star, the Sun, and everything bound to it by gravity - the planets Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, and Neptune; dwarf planets such as Pluto; dozens of moons; and millions of asteroids, comets, and meteoroids.
