9.1. Introduction. All thermal power plants (including concentrating solar thermal, CST) need a cooling system to cool the turbine exhaust. It is well known that the Carnot cycle efficiency ($\eta_{\text{thermal}} = 1 - \frac{T_L}{T_H}$) is maximized with the highest possible heat source temperature T_H and the lowest possible heat sink temperature T_L . According to this ...

In a study of failure pattern carried out on 350 operating PV plants over two years, the root cause behind 52% of the reported failures was attributed to inferior parts and materials used in the PV systems, which was responsible for 48% of energy lost, due to failures of different kinds, during the period of study [13]. Apart from the financial loss, there is a bigger implication ...

The Future of Solar Energy considers only the two widely recognized classes of technologies for converting solar energy into electricity -- photovoltaics (PV) and concentrated solar power (CSP), sometimes called solar thermal) -- in their current and plausible future forms.

It also reflects opinions of experts who specialized in the planning and erection of solar power plants and carrying out CRS research projects. The future effort of R& D in these fields should improve efficiencies, increase durability and reliability, and reduce investment and Operation & Maintenance (O& M) costs.
