

In this review, we will focus on the effect of severe plastic deformation, in particular high-pressure torsion (HPT) method, on the band gap and photocatalytic properties of semiconductors and ...

2 days ago; In 1997, the concept of the intermediate-band solar cell (IBSC) was proposed to harvest energy in the region below the bandgap of the absorber layer of a single-junction SC ...

Supporting Information Photoelectrochemical Water Oxidation of GaP<sub>1-x</sub>Sb<sub>x</sub> with a Direct Band Gap of 1.65 eV For Full Spectrum Solar Energy Harvesting Mahdi Alqahtani<sup>1,2</sup>, Sanjayan Sathasivam<sup>3</sup>, Lipin Chen<sup>4</sup>, Pamela Jurczak<sup>1</sup>, Rozenn Piron<sup>4</sup>, Christophe Levallois<sup>4</sup>, Antoine L<sup>2,3,4</sup>, Yoan L<sup>2,3,4</sup>, Soline Boyer-Richard<sup>4</sup>, Nicolas Bertru<sup>4</sup>, Jean-Marc Jancu<sup>4</sup>, ...

This achievement is groundbreaking, as it marks the first demonstration of a flexophotovoltaic-induced voltage exceeding the material band gap, underscoring the vast potential of strain gradients in enhancing ...

Figure 2 (a) The formation energy of bulk halide double perovskites (HDPs) calculated using the Perdew-Burke-Ernzerhof (PBE) generalized gradient approximation (GGA) and including spin-orbit (SO) coupling. The dotted lines show the formation energy for the orthorhombic phase of with and I [] for comparison. (b) The band gap values for the stable bulk ...

Bandgap-Engineered Iron Oxides for Solar Energy Harvesting. Written By. Munetoshi Seki. Submitted: 30 October 2017 Reviewed: ... They are currently recognized as the most promising materials in magnonics and ...

Tuning the band gap of ferroelectric materials to visible region without reducing the polarization can provide an ideal photovoltaic material for solar energy harvesting, significantly efficient than the conventional p-n junction-based cells. In the present work, we have tried to achieve this elusive goal by doping Mo at the Ti ionic site in proper ferroelectric PbTiO<sub>3</sub> which ...

As a result, with an increasing MAI concentration of 4 mg/ml, the J<sub>sc</sub> was increased to 23.52 mA/cm<sup>2</sup>, resulting in a high PCE of 16.67% in the MAPbI<sub>3-x</sub>Cl<sub>x</sub>-based perovskite solar cells. Zhang et al. examine the impact of tuning the band gap on performance in perovskite solar cells.

Some other materials which are used for making the absorber layer of solar cells include CdTe and Copper Indium Gallium Selenide (CIGS). Among low band gap materials, direct band gap materials are preferable to indirect band gap materials because the former have much higher absorption coefficients.

Wide band gap semiconductors are important for the development of tandem photovoltaics. By introducing buffer layers at the front and rear side of solar cells based on selenium; Todorov et al ...

# Band gap for solar energy harvesting materials

Luque and Marti first devised the concept of an IBSC, depicted in Fig. 13(a), in 1997 as a method for harvesting sub-band-gap solar photons.<sup>4</sup> In an IBSC device, both high- and low-energy photons are absorbed by the solar cell simultaneously. The high-energy photons are harvested in a top "host" material with relatively wide band gap ...

Energy harvesting (also known as power harvesting or energy scavenging or ambient power) is the process by which energy is derived from external sources (e.g., solar power, thermal energy, wind energy, salinity gradients, and kinetic energy, also known as ambient energy), captured, and stored particularly for small, wireless autonomous devices, like those ...

Roadmap on energy harvesting materials, Vincenzo Pecunia, S Ravi P Silva, Jamie D Phillips, Elisa Artegiani, Alessandro Romeo, Hongjae Shim, Jongsung Park, Jin Hyeok Kim, Jae Sung Yun, Gregory C Welch, Bryon W Larson, Myles Creran, Audrey Laventure, Kezia Sasitharan, Natalie Flores-Diaz, Marina Freitag, Jie Xu, Thomas M Brown, Benxuan Li, Yiwen ...

Solar-powered water evaporation -- the extraction of vapour from liquid water using solar energy -- provides the basis for the development of eco-friendly and cost-effective freshwater production.

Combining band gap engineering (doping) and carrier transport (nanorod) research, doped nanorods were investigated. It is found that Nb doped nanorods show a higher conductivity, a better back contact between FTO and nanorod, an easy BAND GAP ENGINEERING AND CARRIER TRANSPORT IN TIO 2 FOR SOLAR ENERGY HARVESTING Mengjin Yang, Ph.D.

Request PDF | Band Gap Engineering of Semiconductors and Ceramics by Severe Plastic Deformation for Solar Energy Harvesting | The electronic structure of the band gap determines the amount of ...

Band gap engineering, as a result, plays a significant part in realizing highly efficient PSCs. A standard anatase TiO<sub>2</sub> with a band gap of  $E_g = 3.2$  eV can absorb just 5% of solar energy, which affects solar cell output and performance.

It is well known that the optimal band gap of direct gap materials used for making the absorber layer of a solar cell is between 1.1 eV and 1.4 eV [3]. Materials with band gaps higher ...

This behavior leads to unique characteristics, such as a photocurrent that depends on light polarization and a photovoltage that can exceed the band gap of the semiconducting material. In contrast, the ...

The optical band gap energy and electro-chemical band gap energy of the synthesized FeS<sub>2</sub> were investigated by UV-vis spectrophotometry and cyclic voltammetry. Finally band gap engineered FeS<sub>2</sub> has been successfully used in conjunction with conjugated polymer MEHPPV for harvesting solar energy. The energy

# Band gap for solar energy harvesting materials

conversion efficiency was obtained as 0 ...

Photovoltaics (PV) provides the conversion of light quanta, photon, into direct current electricity through band gap materials. Typically, the energy conversion starts with the light-harvesting that is being absorbed by electrons in the valence band, causing excited electrons to transfer to a high energy state, and thus become free to move across the conduction band.

Band Gap Engineering of Semiconductors and Ceramics by Severe Plastic Deformation for Solar Energy Harvesting. Hadi Sena, Masayoshi Fuji. Author information ... The material had a band gap of 2.9 eV in the visible-light region with desirable band structure and good photocatalytic activity for water splitting.

More recently, new materials have emerged as potential alternatives to replace the silicon-based cells. First, dye sensitized solar cells (DSSC) were invented in 1991 by O'Regan and Grätzel aiming to provide much lower material costs combined with a cheap and simple manufacturing technology [5]. More recently, an organohalide perovskite sensitizer in a DSSC ...

A solar cell delivers power, the product of current and voltage. Larger band gaps produce higher maximum achievable voltages, but at the cost of reduced sunlight absorption and therefore reduced current. This direct trade-off means that only a small subset of materials that have band gaps in an optimal range have promise in photovoltaics.

Finding new solar cell materials among the vast elemental combinatorial space is an onerous task--one that should not be left to serendipity. Two recent papers, one published in npj Computational Materials and another in Journal of Physical Chemistry C, report advanced machine learning approaches to predict the band gap of new ABX<sub>3</sub> perovskite materials. ...

So far there are different kinds of ways for energy harvesting, for example, wind power, hydraulic power, solar power and thermal power etc. Piezoelectric energy harvester is materials based power generator. ... This might prove that single crystal is a good choice energy-harvesting materials. However, potential problems of the crystal, such as ...

materials scientists have synthesized and characterized a new semiconductor material that consists of an atomically thin (0.7-nm) layer of selenium and molybdenum that has an ideal band gap for solar

Band gap engineering strategies are critical for optimizing energy band structures, which have a significant impact on light harvesting and PCE (Prasanna et al., 2017, Hu et al., 2019). Fig. 8 depicts the band gap and energy band alignment of various perovskite, electron, and hole transport materials (Kulkarni et al., 2014).

Request PDF | Synthesis of Nanocrystalline FeS<sub>2</sub> with Increased Band Gap for Solar Energy Harvesting | In this paper, we have reported the synthesis of FeS<sub>2</sub> of higher band gap energy (2.75 eV) by ...

# Band gap for solar energy harvesting materials

Photovoltaic cells are able to convert sunlight into electricity, providing enough of the most abundant and cleanest energy to cover our energy needs. However, the efficiency of current photovoltaics is significantly impeded by the transmission loss of sub-band-gap photons. Photon upconversion is a promising route to circumvent this problem by converting these ...

Solar-driven interfacial evaporation system is attracting intensive attention for harvesting clean water in the utilization of solar energy. To improve solar-driven interfacial evaporation performance for better application, structuring a solar absorber with high solar-thermal conversion efficiency is critical. Semiconductor materials with stable and economic properties are good ...
