For this blog, we focus entirely on lithium-ion (Li-ion) based batteries, the most widely deployed type of batteries used in stationary energy storage applications today. The International Energy Agency (IEA) reported that lithium-ion batteries accounted for more than 90% of the global investment in battery energy storage in 2020 and 2021.

Batteries and similar devices accept, store, and release electricity on demand. Batteries use chemistry, in the form of chemical potential, to store energy, just like many other everyday energy sources. For example, logs and oxygen both store energy in their chemical bonds until burning converts some of that chemical energy to heat.

Energy . Energy describes the amount of power produced or consumed over a period of time, measured in watt-hours (Wh), kilowatt-hours (kWh) or megawatt-hours (MWh). Lithium-ion battery manufacturers provide system energy storage ratings in units of kWh, while lead-acid manufacturers rate their products in terms of amp-hours (Ah).
