Computer locks up when opening system power

@Sathya: Thank you for the suggestion. I cracked the case last week and had the computer run for a day with an open case and the temps dropped into the 40s. This morning I inspected the CPU"s existing cooling system and noticed a lot of dust covering the grills underneath the fan, so I cleaned those up.

Common Causes of Computer Freezes. Resource Exhaustion. RAM becomes fully utilized; CPU reaches 100% usage; Hard drive space runs critically low; Hardware Issues. Overheating components; Failing hard drive; Unstable RAM modules; Power supply problems; Software Problems. Driver conflicts; Software bugs; Operating system errors; Malware ...

As you may have noticed, computers can freeze or lock up for many reasons. Some additional common causes include: If a computer does not have sufficient memory for the programs it"s being asked to run, it may freeze due to a lack of system resources.

Press Windows + "R" and type powercfg.cpl to open Power Options. Click on Choose what the power buttons do. Select Change settings that are currently unavailable. Uncheck Turn on fast startup (recommended). Click on Save changes. Reboot your system and see if it boots normally now. Disable Hardware Acceleration

Most PSUs are not like work or fail, like one day you press your power button and nothing happens, they tend to get unstable over the years of usage, and sometimes bring not enough voltage to the gpu or cpu. The drivers then stop working and either the system crashes, or freezes, or simply restarts.

Choose Restart from the pop-up menu, and your computer shuts down and restarts, hopefully returning in a better mood. Approach 3: If the preceding approaches don"t work, turn off the computer by pressing its power button. (If that merely brings up the Turn Off the Computer menu, choose Restart, and your computer should restart.)

A faulty memory card is one of the most common causes of computer freezes. So before you invest in a new computer, check to see if your memory card is at fault. Microsoft has a built-in tool to help you do this. 1) On your keyboard, hold the Windows logo key and press R at the same time to invoke a Run command.

pc freezes and plays an audio bit on loop (if audio is played before) and needs to be rebooted by holding the power button. along with that it has been bluescreening even when starting up the pc, though its not as often as freezing I"m not sure if it is a ram problem, but I did look around some more and people just keep saying "swap the ram"

i had a similar issue before and it was entirely unrelated to adblock or any other extensions. amd ryzen 5 4600h with nvidia gtx 1650 ti gpu, video playback on chrome would sometimes freeze my computer specifically when i paused the video or when a video ended. i had to hard reboot every time and it was getting

more frequent so i started looking for a solution myself. i had previously ...

If your computer remains locked up, try the next solution. To restart a locked up computer, press and hold the Power button until the computer turns off. Wait a few seconds, and then press the power button to turn the computer back on.

Solution 1. Run System File Checker and Fix the Freezing Computer 1. Right-click the Start button and select "Command Prompt (Admin)". 2. Type "sfc /scannow" into the Command Prompt window and press Enter to run a full system scan. Leave the Command Prompt to run - this may take between 5-10 minutes.
