To realize how low these efficiencies are, we must remember that a machine having an efficiency of 20 percent loses, in the form of heat, 80 percent of the energy it receives. Electric motors transform electrical energy into mechanical energy much more efficiently.

They run at essentially constant speed from zero to full-load. The speed is frequency-dependent and, consequently, these motors are not easily adapted to speed control. However, variable frequency electronic drives are being used more and more to control the speed of commercial induction motors.
