Summary Remarks This chapter has introduced the readers to the basic concepts in power system analysis, namely modeling issues, power flow studies, and dynamic stability analysis. The concepts have been illustrated on simple power system representations.

Power systems have evolved from the original central generating station concept to a modern highly interconnected system with improved technologies affecting each part of the system separately. The techniques

for analysis of power systems have been affected most drastically by the maturity of digital computing.

SA specifications are formalized by formally specifying flow value types as ADT's in DD's, formally specifying P-Specs using both the assertional style of the aforementioned specification languages and ADT operations defined in DD's, and adopting a formal semantics for DFD "execution steps".
