Elastic potential energy is the energy stored by stretching or compressing an elastic object by an external force. It is equal to the work done to stretch the spring which depends on the spring constant k and the distance stretched. According to Hooke's law, the force applied to stretch the spring is directly proportional to the amount of stretch.

potential energy energy due to position, shape, or configuration potential energy of a spring the stored energy of a spring as a function of its displacement; when Hooke's law applies, it is given by the expression $\frac{1}{2} k x^2$ where (x) is the distance the spring is compressed or extended and (k) is the spring constant

In the context of Hooke's Law, the extent of deformation is also known as the strain on the object. The constant of proportionality in Hooke's Law is referred to as the spring constant and denoted by " k ". It measures the stiffness of the object. The formula $F = kx$ represents Hooke's Law, where F is the applied force, k is the spring ...

Springs and Hooke's Law: A brief overview of springs, Hooke's Law, and elastic potential energy for algebra-based physics students.. Many materials obey this law of elasticity as long as the load does not exceed the material's elastic limit. Materials for which Hooke's law is a useful approximation are known as linear-elastic or "Hookean" materials.

The relationship between strain and elastic energy is simplified by introducing a stress state parameter based on the generalised Hooke's law. It is assumed that the micro-element strengths ...

The force exerted to stretch or compress a spring is known as Hooke's law, $F_s = -k s x$, where F_s is force, x is the displacement, and $-k s$ is the spring constant. The spring constant being unique for every spring depends ...

The earliest constitutive equation, Hooke's law, is proposed by Robert Hooke and describes that the deformation of a material within the elastic range is proportional to the external force. Because rock is a nonlinear elastic-brittle material, it is difficult to express its constitutive relation directly by Hooke's law.

Hooke's law is an empirical physical law describing the linear relationship between the restorative force exerted by a spring and the distance by which the spring is displaced from its equilibrium length. A spring which obeys Hooke's law is said to be Hookean. In addition to springs, Hooke's law is often a good model for arbitrary physical systems that exhibit a ...

The value of R is $8.314 \text{ J mol}^{-1} \text{ K}^{-1}$, or $0.082 \text{ l atm K}^{-1} \text{ mol}^{-1}$ using this latter value, the volume of a mole of gas can be readily found to be 22.4 l at 273 K or 0°C . For a constant volume, such as that of a bicycle tire, the pressure is ...
