Event 41 critical microsoft-windows-kernel-power system

what power plan are you running in settings/system/power, click on the Additional power settings link under related settings? Are you on high performance? i see lots of pc that can cope with running full speed but crash at idle, it seems odd to me. you might want to run HWINFO and log system performance to see if any sensors offer a clue.

The Kernel-Power critical error is typically associated with Event ID 41. Furthermore, Kernel-Power Event ID 41 is accompanied by the keywords (70368744177664), (2), which you can use to pinpoint your bug troubleshooting. So, what causes Kernel-Power error 41?

The "Kernel Power" return is when the hardware reports a loss of power or fluctuation that caused the computer to reset. The ultimate fix for this error is to replace the power supply, but there are few things you can try first.

- o Check all power cables, cables from power supply into motherboard and GPU are all in place and tight.
