

The main objective of this work is to develop PR to integrate and test the performance of BESS in an interconnected two-area power system with variable power penetration from RES in order to explore the capability of providing frequency regulation to the power system with RES and BESS.

Patino J, Valencia F, Espinosa J (2017) Sensitivity analysis for frequency regulation in a two-area power system. *Int J Renew Energy Res* 7(2):700-706. Google Scholar Patiño J, López JD, Espinosa J (2018) Analysis of control sensitivity functions for power system frequency regulation. In: Figueroa-García JC, López-Santana ER, Rodríguez ...

The increasing penetration of PV generation into power systems has led to a reduction of system frequency regulation capability and has caused frequency instability [4, 5]. To enhance the frequency stability of a power system, system operators in some countries and regions have requested that PV systems should actively participate in the ...

Frequency Regulation is a fundamental aspect of electrical engineering, ensuring that power systems operate reliably and efficiently. By maintaining stable frequency levels, engineers can ...

With a low-carbon background, a significant increase in the proportion of renewable energy (RE) increases the uncertainty of power systems [1, 2], and the gradual retirement of thermal power units exacerbates the lack of flexible resources [3], leading to a sharp increase in the pressure on the system peak and frequency regulation [4, 5]. To circumvent this ...

Frequency support from renewable power generators is critical requirement to ensure the frequency stability of remote area power supply (RAPS) systems with high penetration of renewable power generation. However, traditional control strategies and the stochastic nature of wind resource constrain wind energy conversion system (WECS) such as permanent magnet ...

Compared with thermal power unit frequency regulation, the battery storage with improved droop control and improved virtual inertia control in cooperation with thermal power unit frequency regulation is enough to make the lowest value of frequency droop have 0.124 Hz and 0.143 Hz recovery, and the system frequency can be restored to stability ...

In order to maintain the grid frequency stability of the multi-area LFC power system in an open communication network, an observer-based waiting event-triggered scheme ...

Due to high penetration of renewable energy sources, inter-area oscillations (IAOs) have become serious concern for power system stability. Hence, a wide-area damping controller (WADC) strategy is proposed for thyristor-controlled series compensator (TCSC) device to effectively damp IAOs. The feedback signals for the WADC design are selected by the modal sparse linear ...

Ekinci, S. et al. Frequency regulation of PV-reheat thermal power system via a novel hybrid educational competition optimizer with pattern search and cascaded PDN-PI controller. Results Eng ...

Therefore, maintaining system quality and stability in terms of power system frequency control is one of the major challenges that require new resources and system integration. Battery energy storage systems (BESSs), as fast-acting energy storage systems, with the capability to act as a controllable source and sink of electricity are one of the ...

The frequency regulation process is typically classified into three major control stages: primary, secondary, and tertiary. Before triggering the primary frequency controller ...

In the future, the modern RES-based integration in power systems and frequency regulation control will be key issues to be resolved. A lack of inertia and suitable damping would be encountered with these RES-based systems. Consequently, adequate control schemes and additional services such as secondary and primary reserves are required to ...

Primary frequency regulation (PFR) is a crucial operating condition for PSPs to realise frequency modulation, and the effectiveness of PFR is significant to the stability of power system frequency. Several challenges and risks have been presented in the PFR process for conventional PSPs, especially for those which run in the isolated grid, such as water inertia, ...

The parameter R_p is the static droop coefficient for frequency containment, T_s is the integration time constant for the frequency restoration regulation, w_{ref} is reference frequency (i.e., nominal frequency), w_m is measured actual frequency, P_{set} is the power set-point scheduled for the generator, and P_{ref} is the power ...

AGC systems automatically adjust the output of power plants to stabilize the frequency. These systems can increase or decrease the generation of electricity within seconds to counteract deviations. ... markets have been established for frequency regulation services. Power producers and consumers can participate in these markets, providing grid ...

Automatic generation control is extensively used to regulate power plants in a modern area of the power system network. In this paper, automatic generation and frequency control in interconnected power system is presented. A multisource such as thermal, hydro, and gas-based power plant is considered in this study, which is carried out by incorporating ...

Meanwhile, from the frequency regulation viewpoint, wind integrated power systems need more spinning/non-spinning reserve and/or storage devices due to intermittent and variable nature of wind speed [8], [9], [10] Refs.[28]

This paper reviews and updates the status of power system frequency control and identifies future research directions that are required to be addressed in the synthesis and ...

additional regulation power and new ancillary services to compensate frequency deviations [11]. The regulation power reserve provided by microsources/DGs and Microgrids (MGs) may support the system robustness against various disturbances and reduce frequency fluctuations. Due to the fast response of power electronic interfaces, this regulation ...

This in turn, supports frequency dynamics in inertial response horizon (see Fig. 3). Fig. 4 shows the contribution of all discussed frequency control loops in timescale of second up to minutes, following a disturbance at t_0 , to support the modern power system frequency control. Fig. 3. Frequency control loops in modern power systems. Fig. 4.

1. Introduction. LFC has been widely utilized in multi-area interconnected power system to maintain the scheduled values of frequency and tie-line power for many years [1], [2], [3], [4]. For multi-area interconnected power system, there are two different channels to connect the interconnected areas: private communication channels and common communication ...

Until 2017, the installed wind power of 539 GW and the solar power of 402 GW worldwide [1] had reached penetration rates of 7.9% and 5.9%, respectively, of the total global installed power capacity, which was approximately 6790 GW [2]. The renewable energy sources (RESs) in some regional power systems, such as those of the Gansu, Ningxia and Xinjiang ...

Early publications in the field of power grid frequency regulation include [2], which discussed the results of an analysis of the dynamic performance of automatic tie-line power and frequency control of electric power systems. The study consisted of simple 2-area power system with a single machine in each area.

Elkasem, A.H.A., Kamel, S., Khamies, M. et al. Frequency regulation in a hybrid renewable power grid: an effective strategy utilizing load frequency control and redox flow ...

throughout the power system under normal and contingency conditions. Dynamic reactive reserves respond quickly in the event of voltage transients that can lead to voltage collapse and are the most valuable to the power system.

This article presents frequency regulation of an interconnected three-area power system (Thermal + Wind +

Hydro). Fractional Order PID (FOPID) and Proportional-Integral-Derivative (PID ...

The transfer function model shown in Fig. 2 is a single-area/islanded system hybrid power system consisting of RTG, WG, FC, AE, DEG, and BESS. Figure 3 shows the transfer function model of the AVR system used for maintaining the voltage deviation in the system. Controllers 1 and 2 adjust the output power of the RTG and AC microgrid, allowing the system ...

Wind power (WP) is considered as one of the main renewable energy sources (RESs) for future low-carbon and high-cost-efficient power system. However, its low inertia characteristic may threaten the system frequency stability of the power system with a high penetration of WP generation. Thus, the capability of WP participating in the system frequency ...

Open Access. Overview of frequency control techniques in power systems with high inverter-based resources: Challenges and mitigation measures. Dlzar Al Kez, Aoife M. Foley, ...

Abstract. Integration of more renewable energy resources introduces a challenge in frequency control of future power systems. This paper reviews and evaluates the possible ...

4. Case study. The proposed dynamics-constrained distributed frequency regulation method is investigated in this section. We first conduct simulations on a modified version of IEEE 9-bus system [33], with 3 SGs, a PV farm, a wind farm and 4 ES devices, shown in Fig. 5. The total rated power of the system is 200 MW.

This paper presents a Frequency Regulation (FR) model of a large interconnected power system including Energy Storage Systems (ESSs) such as Battery Energy Storage Systems (BESSs) and Flywheel Energy Storage Systems (FESSs), considering all relevant stages in the frequency control process. Communication delays are considered in the transmission of the signals in the ...
