

# How do non-renewable energy sources affect the environment

Coal, oil and natural gas are known as non-renewable sources of energy because they exist in limited quantities in nature. In other words, they are generated from finite resources or they take an extremely long time to regenerate.

**Abstract.** Rising energy production and consumption, particularly from fossil fuels, pose substantial threats to both global climate and human well-being. Conventional fossil fuel technologies, as...

**Nature Energy** - Climate change may affect energy systems by altering energy consumption patterns and production potential, with varying levels of impact across regions. This review...

This study investigates the dynamic impact of non-renewable energy (coal, gas, and oil), renewable energy, economic growth, and capital formation on CO<sub>2</sub> emissions and the ecological footprint in Indonesia spanning from 1965-2022.

The first energy problem of the world is the problem of energy poverty - those that do not have sufficient access to modern energy sources suffer poor living conditions as a result. The second energy problem: those that have access to energy produce greenhouse gas emissions that are too high

Given the negative effects of non-renewable energy and urbanisation on environmental quality, Asongu et al. (2020) recommend the need for a paradigm shift from fossil fuel sources to renewable energy sources and to embrace carbon storage and capturing

**Air pollution.** Non-renewable energy sources are not just altering our Earth's atmosphere by increasing the amount of greenhouse gas emissions. They also emit a variety of pollutants that affect people's health and the environment. For example, coal-fired power plants are the single largest source of mercury emissions in the US.

**Fast Fact. Fossilized Energy.** According to the Central Intelligence Agency, the world generates more than 66 percent of its electricity from fossil fuels, and another 8 percent from nuclear energy. Nonrenewable energy comes ...

This shows the positive effect on the environment by just using non-renewable energy sources and exploiting natural resources. Economic development's positive and negative effects on ecological footprint have shown the inverted U-shaped EKC hypothesis in BRICS.
