Energy is stored by lifting blocks and stacking them at a height, then utilizing their gravitational potential energy to fall back to the ground and drive a generator. Standard systems are built with 35 MWh of storage and a power rating of 4 or 8 MW, consisting of a 150 meter high tower and up to 7,000 blocks.

When electricity production exceeds demand or the prices are low, electricity is consumed to lift these weights to the upper parts of the building, where they are stored on racks. When demand or price is high, the weights fall to generate electricity. ... multi-weight energy storage facility in northern England [7].

Other technical routes suggest using iron as the weight to increase the energy storage capacity. However, when industrial waste is available, priority should be given to processing industrial waste into heavy material, as this avoids the cost of the heavy material part and brings benefits in pollution abatement. ... The Lift Energy Storage System (LEST) would make use of the existing elevator systems in tall buildings. Many of these are already designed with regenerative braking systems that can harvest energy as a lift descends, so they can effectively be looked at as pre-installed power generators.

Gravity Energy Storage (GES) is an emerging renewable energy storage technology that uses suspended solid weights to store and release energy. This study is the first to investigate the feasibility of using unstabilized Compressed Earth Blocks (uCEBs) as a cost-effective and sustainable alternative for weight manufacturing in GES systems.

Let's pick a height to lift our weight that is workable and say 3 m (approximately 10 feet) Rearranging our formula $m = e/gh$ or $m = 1.2 \times 10^5 \text{ kg}$ or 120,000 kg or about the weight of 86 Toyota Prius Cars. Perhaps we are going to have to do some major energy conservation here.

Lifted Weight Storage (LWS) operates in pretty much the same way as the PHS, only it uses compressed soil instead of water. The facility consumes energy from the grid lifting the weights up to the height of a few hundred meters and generates energy as needed when the weights go down affected by gravity.
