The "Failure Analysis for Molten Salt Thermal Energy Tanks for In-Service CSP Plants" project was inspired on this recommendation and was focused on (1) the development and validation of a physics-based model for a representative, commercial-scale molten salt tank, (2) performing simulations to evaluate the behavior of the tank as a function of ...

These requirements significantly simplify the refueling infrastructure and the costs induced by it. Even if the storage in metal hydride tanks onboard ships has been sparsely investigated, their investment costs can be up to 7000 EUR/kg H₂ in the most favorable scenario and, at a system level, still be competitive with compressed hydrogen storage.

Whereas conventional tanks infrastructures are made of stainless steel and insulated as is shown in Fig. 2-left, the design of this hybrid thermocline tank concept (Fig. 2-right) comprises layers from the heat source to the external surface as follows: 1) a thin steel liner working as a container for the molten salts, 2) an air gap interface to ...

One of the failure mechanisms in the steel used in CST and CSP plants' thermal energy storage tanks has been isolated and a steel formulation from the Finnish stainless steel firm Outokumpo has now successfully passed testing by the Colorado School of Mines. A tank thermal energy storage system generally consists of reinforced concrete or stainless-steel tanks as storage containers, with water serving as the heat storage medium. For the outside of the tank, extruded polystyrene (XPS) is used as an insulation material, and stainless steel is used for the interior to prevent water vapor from spreading.
