Microwave energy absorption and heating response can be clear demonstrated within each period [93]. First period corresponds to the rise in temperature due to the absorption of power by the mixture corresponding to cement and water. When the temperature reached the evaporation condition, 100 °C, all electromagnetic absorbed power contributed ...

Conventional TBM tunnelling is limited by the status of surrounding rock, bit wear, bit maintenance and construction cost. The microwave pre-heating of rock combined with TBM could improve the penetration speed effectively. Localized microwave heating, concentration of microwave energy, in other words, could rise the temperature rapidly.
