Night sky with planets

Planets - Five planets in our solar system are easily observed without a telescope: Mercury, Venus, Mars, Jupiter and Saturn. Uranus is just barely visible for those with excellent eyesight under dark-sky conditions, provided you know where to look. The planets appear to move across the sky, against the background of the much more distant stars.

Finding planets in the night sky is a rewarding ability that lets you have a deeper knowledge of the universe--if you know what you are looking for! Because the night sky is an ever-changing display, you'll have to learn how to distinguish planets from non-planets when you look up. What you see will also depend on where you are on Earth, what ...

The night sky tonight and on any clear night offers an ever-changing display of fascinating objects you can see, from stars and constellations to bright planets, the moon, and ...

Saturn is visible during most of the night, but it is best viewed in the late evening hours after sunset. Uranus can be seen for more than 10 hours during the late night/early morning and until sunrise. You may need binoculars. Neptune is roughly in the opposite direction of the Sun, so it is visible during most of the night.

This month, catch planetary views of Saturn, Jupiter, and Mars, witness a close pass of the Parker Solar Probe by Venus, and get ready for an occultation of the bright star Spica by the Moon. This is the Night Sky Network ...

The Sky-Watcher Star Adventurer GTi is a highly portable star tracker that was designed for astrophotography. It allows you to take long-exposure images of space by tracking the apparent movement of the night sky. Unlike the original Star Adventurer, the GTi model also has the ability to find deep-sky objects in the night sky using...
