

Photovoltaic Cell Defined: A photovoltaic cell, also known as a solar cell, is defined as a device that converts light into electricity using the photovoltaic effect. Working Principle: The solar cell working principle involves converting light energy into electrical energy by separating light-induced charge carriers within a semiconductor.

The principle of operation of photovoltaic cells, the photovoltaic effect, was first observed by French physicist Edmond Becquerel in 1839. He discovered that certain materials would produce small amounts of electric current when exposed to light. This effect is a direct conversion of light energy (photons) into electrical energy by the action ...

The photovoltaic process bears certain similarities to photosynthesis, the process by which the energy in light is converted into chemical energy in plants. Since solar cells obviously cannot produce electric power in the dark, part of the energy they develop under light is stored, in many applications, for use when light is not available.
