Printable solar cells offer exciting potential for generating electricity more flexibly and at a lower cost, wherever the sun shines. Traditional silicon solar PV, which is commonly used and seen on people's rooftops, has the most costly component being the silicon material that holds the photovoltaic elements.

Crystalline silicon (c-Si) is an extremely popular semiconductor made into wafers, which are then used in the manufacturing of 95% of the world's photovoltaics. [4] Due to its prevalence in the solar cell industry, it would appear to be an ideal substrate for flexible solar cells. Unfortunately, c-Si is brittle, and while some researchers have made solar cells from amorphous silicon that are ...
