Fluctuating solar and wind power require lots of energy storage, and lithium-ion batteries seem like the obvious choice--but they are far too expensive to play a major role.

In the study, the Stanford team considered a variety of storage technologies for the grid, including batteries and geologic systems, such as pumped hydroelectric storage. For the wind industry, the findings were very favorable. "Wind technologies generate far more energy than they consume," Dale said.

Commercially available wind turbines range between 5 kW for small residential turbines and 5 MW for large scale utilities. Wind turbines are 20% to 40% efficient at converting wind into electrical energy. The typical life span of a wind turbine is 20 years, with routine maintenance required every six months. Wind turbine power output is variable

The use of energy storage for increased operational flexibility is commonly regarded as a logical complement for systems with large amounts of wind power.
