The unpredictable daily and seasonal variations in demand for electrical energy can be tackled by introducing the energy storage systems (ESSs) and hence mitigating the extra GHG emission in the atmosphere. Energy storage techniques can be mechanical, electro-chemical, chemical, or thermal, and so on.

Fig. 9 captures the total installed capacity for energy storage systems. An electrical energy storage system is made up of a storage unit, as well as a power-converting unit. The direct current voltages are utilised for operating the energy storage unit with the aid of an inverter for transforming the DC current to an alternating current.

Progress in electrical energy storage system: A critical review. Haisheng Chen, ... Yulong Ding, in Progress in Natural Science, 2009. The costs per cycle kWh of PHS and CAES are among the lowest among all the EES technologies, the per cycle cost of batteries and flow batteries are still much higher than PHS and CAES although a great decrease has occurred in recent years.
