As its name implies, photovoltaics is the direct conversion of light (photo) to electricity (-voltaic). It is explained by the great scientific advance of the 20 th century, namely quantum physics. In this section we discuss the nature of light and the interaction with matter.

Section Goals. Understand semiconductor function within the context of PV. Learn how to optimize semiconductor performance in PV. Understand why silicon is the most commonly used semiconductor material for PV applications.

Although the bulk of photovoltaic devices today are used for purely practical and economic reasons, a potential benefit of photovoltaics is that PV is one of the most environmentally benign of any electricity generating source.

We have had requests for an offline version of the pveducation site. It is available as a zip file below but it is provided "as is". We expect there will be errors and missing animations etc as our efforts concentrate on the online version. [Download Link](#)

The wide range of semiconductor applications comes from the ability to easily change their conductivity. The addition of even very small amounts of impurities, known as dopants, can change their material conductivity over orders of magnitude even though the impurity concentration might be very small with concentrations of the order of parts per billion.

The studies in solar PV education showcase the promising potential of using virtual reality technology as a learning method that offers an immersive and interactive environment, enhancing users' comprehension of solar energy systems and their functionality. Most of the studies offer practical training environments for

students, enabling hands ...

The light that we see everyday is only a fraction of the total energy emitted by the sun incident on the earth. Sunlight is a form of "electromagnetic radiation" and the visible light that we see is a small subset of the electromagnetic spectrum shown at the right.

PV Education: How Photovoltaic Energy Works. For those who use PV solar energy you will already know that installing and using solar panels is a straightforward process. What goes on inside those panels is the complicated part. Here at Solar Sena we want to give you the best PV education possible so you know how your technology works.

The atoms in a semiconductor are materials from either group IV of the periodic table, or from a combination of group III and group V (called III-V semiconductors), or of combinations from group II and group VI (called II-VI semiconductors).

The above equation shows that V_{oc} depends on the saturation current of the solar cell and the light-generated current. While I_{sc} typically has a small variation, the key effect is the saturation current, since this may vary by orders of magnitude. The saturation current, I_0 depends on recombination in the solar cell. Open-circuit voltage is then a measure of the amount of ...
