Batteries for power tools and other commercial devices can often be repaired by replacing one or all cells. Finding a NiCd and NiMH cell is relatively easy; locating an appropriate Li-ion cell is more difficult.

If the cell (or cells) really do need replacement, plan for the introduction of the new cell(s) into the battery pack. The new cells should be the same type of cell as the rest of the pack. Since the battery pack is only as strong as the weakest cell, only new cells that are in the same or better condition than the rest of the pack should be used.

Lithium-ion batteries and related chemistries use a liquid electrolyte that shuttles charge around; solid-state batteries replace this liquid with ceramics or other solid materials.

If a relatively new pack has only one defective cell and a replacement is located, exchanging the affected cell makes sense. With an aged battery, however, it's best to replace all cells. Mixing new with old causes a cell mismatch that has a short life. In a well-matched battery pack all cells have similar capacities.
