Batteries are batteries, and any battery will work in the tool as long as it fits and is the correct voltage. The problem is your NiCd charger almost certainly will not work with Lion batteries - and could actually cause a fire or explosion. If you do get a different battery type, just make sure you have a charger that is compatible.

One day I was looking at those two cordless power tools on my workbench, and just been thinking, that will be very nice to get rid of old, heavy and small capacity NiCd battery by replacing it with lithium battery pack from Bosch impact driver. From electric side it's totally possible, because both power tools are operating at same voltage - 18V.

Lithium-ion batteries accept rapid charging until reaching 70% of their capacity. After that, charging slows down. ... Lithium maintains capacity longer but isn't immune. Regularly replace old batteries for peak performance. †; Temperature Tolerance. ... In the nimh vs nicd vs lithium trio, Lithium batteries are most prone to venting if ...

When replacing a lead-acid battery with a nickel-cadmium battery, the battery compartment must be clean, dry, and free of all traces of acid from the old battery. The compartment must be washed out and neutralized with ammonia or boric acid solution, allowed to dry thoroughly, and then painted with an alkali resisting varnish.

Replacing NiCad batteries with lithium batteries can be as simple as popping out the old ones and putting in the new ones or as complicated as having a battery pack custom made for the job, ...

Due to advances in battery circuitry, however, chargers are not forward-compatible; the charger that came with a nicad tool will not work with lithium-ion batteries. David Frane is a former foreman with Thoughtforms Corp., a construction company based in West Acton, Mass., and former editor of Tools of the Trade.

This modern battery technology offers plenty of benefits compared to NiCad or Lithium-ion. A high-capacity battery means you can use these for high-powered devices. They are less prone to memory effect than NiCad batteries. They are less vulnerable when exposed to high temperatures than lithium-ion batteries.

Lithium-ion (or Li-ion) batteries are smaller in size, require low maintenance and are environmentally safer than Nickel-cadmium (also called NiCad, NiCd or Ni-Cd) batteries. While they have similarities, Li-ion and NiCd batteries differ in their chemical composition, environmental impact, applications and costs.

Actually, with Lithium Ion batteries you really want to keep the batteries 100% topped up between uses any how. Lithium Ion batteries thrive on shallow charge-discharge cycles (just the opposite of NiCd) but have a short service life if repeatedly deep-discharged (again, the opposite of NiCd).
