

Solar system information

Learn about the Sun, the planets, the dwarf planets, the satellites, the asteroids, the comets and the interplanetary medium. See diagrams, comparisons, sizes, orbits, classifications and more.

The solar system was formed approximately 4.6 billion years ago by the collapse of a giant molecular cloud. The mass at its centre collected to form the Sun and a flat disk of dust around it. This eventually formed the planets and other bodies of the solar system.. The solar system consists of the Sun, planets, dwarf planets, moons, and numerous smaller objects such as ...

It includes the rocky inner planets Mercury, Venus, Earth and Mars; the gas giants Jupiter and Saturn; and the ice giants Uranus and Neptune. Between Mars and Jupiter is a collection of asteroids known as the asteroid belt, while beyond Neptune is where small icy bodies, like Pluto and comets, live. How old is our solar system?

4 days ago; And like that, the solar system as we know it today was formed. There are still leftover remains of the early days though. Asteroids in the asteroid belt are the bits and pieces of the early solar system that could never quite form a planet. Way off in the outer reaches of the solar system are comets.

Solar System Formation. The solar system is located in one of the spiral arms of the Milky Way galaxy. It was born about 4.5 billion years ago when a cloud of interstellar gas and dust collapsed. Most of the material was pulled toward a central point: nearly all of the solar system's mass--99.8%--is in the Sun.

solar system to scale The eight planets of the solar system and Pluto, in a montage of images scaled to show the approximate sizes of the bodies relative to one another. Outward from the Sun, which is represented to scale by the yellow segment at the extreme left, are the four rocky terrestrial planets (Mercury, Venus, Earth, and Mars), the four hydrogen-rich giant planets ...

The Oort Cloud is considered to mark the edge of the solar system as, beyond that the gravity of the stars begin to dominate that of the sun, says NASA. The inner boundary of the main region of the ...

Our solar system is made up of a star--the Sun--eight planets, 146 moons, a bunch of comets, asteroids and space rocks, ice, and several dwarf planets, such as Pluto. The eight planets are Mercury, Venus, Earth, Mars, ...

Our solar system formed about 4.6 billion years ago. The four . planets closest to the Sun -- Mercury, Venus, Earth, and Mars -- are called the terrestrial planets because they have solid, rocky surfaces. Two of the outer planets beyond the orbit of Mars --

Our solar system is moving with an average velocity of 450,000 miles per hour (720,000 kilometers per hour). But even at this speed, it takes about 230 million years for the Sun to make one complete trip around the

Solar system information

Milky Way. The Sun rotates on its axis as it revolves around the galaxy. Its spin has a tilt of 7.25 degrees with respect to the ...

A lot of astronomy people like to think of the Solar System been made up in two parts We have the Inner Solar System which has Mercury, Venus, Earth and not forgetting Mars. These are closest to the sun and are called the terrestrial planets simply ...

The Solar system is a great place for kids to start learning about the universe. But reading about it can be overwhelming. There is so much information about the Solar system for kids but a lot of it is written using advanced terms ...

Learn about the sun and the planets, dwarf planets, moons, asteroids, comets, and other objects that orbit our star. Discover how the solar system formed, what it's made of, and how it compares to other star systems.

Any natural solar system object other than the Sun, a planet, a dwarf planet, or a moon is called a small body; these include asteroids, meteoroids, and comets. Most of the more than one million asteroids, or minor planets, orbit between Mars and Jupiter in a nearly flat ring called the asteroid belt.

Top 10 facts. Everything in the Solar System revolves around the Sun. The Sun is a star - a massive ball of hot gas that gives off light and heat.; There are eight planets that orbit around the Sun.; The closest planet to the Sun is Mercury, and the farthest away is Neptune.

Facts about the Planets. Mercury's craters are named after famous artists, musicians and authors.; Venus is the hottest planet in the solar system.; Earth's atmosphere protects us from meteoroids and radiation from the Sun. ; There have been more missions to Mars than any other planet.; Jupiter has more than double the mass of all the other planets combined. ...

Our solar system is made up of a star--the Sun--eight planets, 146 moons, a bunch of comets, asteroids and space rocks, ice, and several dwarf planets, such as Pluto. The eight planets are Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, and Neptune. Mercury is closest to the Sun. Neptune is the farthest.

Learn about the Sun, planets, dwarf planets, moons, asteroids, and comets that make up our solar system. Find out how it formed, how big it is, and how it compares to other star systems.

The Nine Planets is an encyclopedic overview with facts and information about mythology and current scientific knowledge of the planets, moons, and other objects in our solar system and beyond. The 9 Planets in Our Solar System

A star system is a group of planets, meteors, or other objects that orbit a large star. While there are many star systems, including at least 200 billion other stars in our galaxy, there is only one solar system. That's because our sun is known by its Latin name, Sol. The solar system includes everything that is gravitationally drawn

Solar system information

into the sun's orbit. Use these resources to learn about ...

Our solar system is in one of the Milky Way galaxy's spiral arms called the Orion Spur. 5. A Long Way Around Our solar system takes about 230 million years to orbit the galactic center. 6. Spiraling Through Space The Milky Way is a barred spiral galaxy. 7. Room to Breathe Our solar system has many worlds with many types of atmospheres. 8.

other solar systems using telescopes on Earth and in space. FAST FACTS. Mean Distance Equatorial from the Sun Radius km, mi, Body km mi millions millions Moons* Sun 695,500 432,200 -- -- -- Mercury 2,440 1,516 57.91 35.98 0

The biggest planet in our solar system . explore; What Is the Weather Like on Other Planets? Each of the planets in our solar system experiences its own unique weather. explore; Is There Ice on Other Planets? Yes, there is ice beyond Earth! In fact, ice can be found on several planets and moons in our solar system.

The solar system is also known as a planetary system. Since the 1990s scientists have found many planetary systems beyond our solar system. In these systems, one or more planets orbit a star--just as the eight planets in our solar system orbit the Sun. These planets are called extrasolar planets.

With these facts about the Solar System, let us learn about it. Facts about Solar System Age! 1. According to cosmologists worldwide, our solar system was formed about 4.5 billion years ago. Cosmology is a physical science and a branch of astrophysics that studies the universe's evolution.

The biggest planet in our solar system . explore; All About the Moon. The biggest planet in our solar system . explore; What Is the Weather Like on Other Planets? Each of the planets in our solar system experiences its own unique weather. explore

The Solar system is a great place for kids to start learning about the universe. But reading about it can be overwhelming. There is so much information about the Solar system for kids but a lot of it is written using advanced terms and doesn't completely answer their questions.
