The overall structure of a solid-state battery is quite similar to that of traditional lithium-ion batteries otherwise, but without the need for a liquid, the batteries can be much denser and compact.

Plus, solid state batteries will charge faster than lithium ion with less degradation to the battery itself. With frightening reports of battery fires in the wake of flooding, EVs have developed a bad rep for being rolling matchsticks. But in reality, that honor should go to the lithium-ion battery.

The key difference between the commonly used lithium-ion battery and a solid-state battery is that the former uses a liquid electrolytic solution to regulate the flow of current, while...

A: A solid-state lithium-metal battery is a battery that replaces the polymer separator used in conventional lithium-ion batteries with a solid-state separator. The replacement of the separator enables the carbon or silicon anode used in conventional lithium-ion batteries to be replaced with a lithium-metal anode.
