Today's conventional lithium-ion EV batteries can store 100 to 265 watt-hours per kilogram (Wh/kg). According to the National Aeronautics and Space Administration (NASA), solid-state batteries are capable of storing up to 500 Wh/kg. Based on these figures, we can see that solid-state batteries can store 2 to 5 times more energy for the same battery weight.

Solid-state batteries offer much higher energy density potential. Thin-film types can reach 300-800 Wh/kg, while bulk types are around 250-500 Wh/kg. Recent research by Mercedes and Factorial claims to have achieved 450 Wh/kg in a new solid-state battery type, which is 33% smaller and 40% lighter than comparable lithium-ion batteries.
