

What is the largest thing in our solar system

Jupiter is the largest planet in the solar system. It's about 11 times wider than Earth with an equatorial diameter of 88,846 miles (about 142,984 kilometers). Jupiter is the fifth planet from the Sun, orbiting at an average ...

Its diameter is about 865,000 miles (1.4 million kilometers). Its gravity holds the solar system together, keeping everything from the biggest planets to the smallest bits of debris in orbit around it. Even though the Sun is the center of our solar system and essential to our survival, it's only an average star in terms of its size.

Both the largest known nebula and most active star-forming region in our local galactic neighborhood, the Tarantula Nebula stretches for more than 1,800 light-years at its longest span.

subsurface ocean; Ganymede, the largest moon in our solar system; and Callisto, which is also thought to have a subsurface ocean and features some of the oldest surface material in the solar system.

The largest objects in the solar system. ... Our solar system has only one star, the Sun. However astronomers have observed that multiple solar systems, with two, three or more stars, are numerous. Without competition, the Sun has become gigantic, it has captured 99.86% of the total mass of dust and gas from the original nebula. ...

Topping our charts for what seems like an eternity and the undisputed holder of the title of Official Largest Object in the Solar System is everybody's favourite star, the Sun! At a width of 1,392,000 km (865,000 miles) and weighing in at almost 2 million million million million kilograms (whoever weighed it must have some pretty big scales!), the Sun is large enough to contain ...

The Sun is the largest object in our solar system. Its diameter is about 865,000 miles (1.4 million kilometers). Its gravity holds the solar system together, keeping everything from the biggest planets to the smallest bits of debris in orbit around it.

Solar System Formation. The solar system is located in one of the spiral arms of the Milky Way galaxy. It was born about 4.5 billion years ago when a cloud of interstellar gas and dust collapsed. Most of the material was pulled toward a central point: nearly all of the solar system's mass--99.8%--is in the Sun.

With a diameter of about 5262 kilometers it is the largest object after the Sun and the planets. It was discovered by Galileo in 1610 and is named after the Greek mythological character Ganymede, who was a handsome young man abducted by Zeus to become the divine cup of Olympus.

2 days ago#0183; Jupiter, the most massive planet of the solar system and the fifth in distance from the Sun is one of the brightest objects in the night sky; only the Moon, Venus, and sometimes Mars are more brilliant.

What is the largest thing in our solar system

Jupiter is designated by the symbol ♃. When ancient astronomers named the planet Jupiter for the Roman ruler of the gods and heavens (also known as Jove), they had no ...

The Sun, our very own star, is a giant in every sense of the word. Its colossal size and mass dominate our solar system, making life on Earth possible. So the next time you look up at the sky on a bright sunny day, remember, you're looking at ...

Our home galaxy is called the Milky Way. It's a spiral galaxy with a disk of stars spanning more than 100,000 light-years. Earth is located along one of the galaxy's spiral arms, about halfway from the center. Our solar system takes about 240 million years to orbit the Milky Way just once.

Jupiter is the largest planet in our solar system since it has the highest mass and the largest diameter. It has an equatorial radius of 44,423 miles, a mass of 4.1848×10^{27} lbs, and a surface area of 2.3733×10^{10} sq mi.

It's the largest planet in our solar system - if it were a hollow shell, 1,000 Earths could fit inside. It's also the oldest planet, forming from the dust and gases left over from the Sun's formation 4.6 billion years ago. But it has the shortest day ...

Our solar system's largest planet is an average distance of 484 million miles (778 million kilometers) from the Sun. That's 5.2 AU. Jupiter is the largest of the planets, spanning nearly 1.75 millimeters in diameter on our football field scale. Jupiter's diameter is about equal to the thickness of a U.S quarter in our shrunken solar system.

The sun, our star, is our solar system's brightest natural object. But you might be surprised by some others that make the list. But you might be surprised by some others that make the list.

Our home galaxy is called the Milky Way. It's a spiral galaxy with a disk of stars spanning more than 100,000 light-years. Earth is located along one of the galaxy's spiral arms, about halfway from the center. Our solar system takes ...

2 days ago; Jupiter, the most massive planet in the solar system and the fifth in distance from the Sun. It is one of the brightest objects in the night sky; only the Moon, Venus, and sometimes ...

Saturn is the sixth planet from the Sun and the second largest planet in our solar system. Adorned with a dazzling system of icy rings, Saturn is unique among the planets. Saturn is a massive ball made mostly of hydrogen and helium. The farthest planet from Earth discovered by the unaided human eye, Saturn has been known since ancient times.

Mars, the red planet, is the seventh largest planet in our solar system. Mars is about half the width of Earth,

What is the largest thing in our solar system

and has an equatorial diameter of about 4,221 miles (6,792 kilometers). Mars is the fourth planet from the Sun, ...

It is the largest object in the solar system. Its diameter, or distance through its center, is 865,000 miles (1,392,000 kilometers). ... Since the 1990s scientists have found many planetary systems beyond our solar system. In these systems, one or more planets orbit a star--just as the eight planets in our solar system orbit the Sun. These ...

The largest planet in our solar system by far is Jupiter, which beats out all the other planets in both mass and volume. Jupiter's mass is more than 300 times that of Earth, and its diameter, at 140,000 km, is about 11 times Earth's diameter. (Jupiter's Great Red Spot, ...

The Sun is about 100 times wider than Earth and about 10 times wider than Jupiter, the biggest planet. The Sun is the only star in our solar system. It is the center of our solar system, and its gravity holds the solar system together. Everything in our solar system revolves around it - the planets, asteroids, comets, and tiny bits of space debris.

Our solar system is made up of a star--the Sun--eight planets, 146 moons, a bunch of comets, asteroids and space rocks, ice, and several dwarf planets, such as Pluto. The eight planets are Mercury, Venus, Earth, Mars, ...

Mercury is the smallest planet in our solar system. Mercury is a little more than one-third the width of Earth, and has an equatorial diameter of about 3,032 miles (4,880 kilometers). Mercury is the closest planet to the Sun, orbiting at an average distance of 36 million miles (58 million kilometers).

Neptune is the only planet in our solar system not visible to the naked eye. In 2011 Neptune completed its first 165-year orbit since its discovery in 1846. ... Neptune's largest moon Triton was discovered on Oct. 10, 1846, by William Lassell, just 17 days after Johann Gottfried Galle discovered the planet. Since Neptune was named for the Roman ...
