A daily update with Science news, great photos, sky alerts. What are star trails, and how do I photograph them? Summer Triangle star: Altair is variable and spins fast!

Discover the planets that are currently visible in the night sky. Learn about their positions, rise and set times, and how to spot them from your location. Whether you're a seasoned astronomer or ...

Planets Visible Tonight - November 2024. The month of November lets us see all of the planets except Mercury, which is too close to the sun for us to spy. Venus, Jupiter and Saturn are all evening planets, along with the ice worlds of Uranus and Neptune. Mars begins the month firmly as a morning planet but moves to allow decent late evening viewing as December comes into ...

## Which planet is visible tonight

Two Comets in October? Around mid-October, C/2023 A3 (Tsuchinshan-ATLAS) may be visible after sunset. Show Tsuchinshan-ATLAS on our Night Sky Map (below).; There were hopes that C/2024 S1 (ATLAS)--a Kreutz sungrazer--might become bright toward the end of October. However, the latest indications are discouraging.

Mars, the &quot;Red Planet&quot;, captivates stargazers with its distinct reddish hue, diverse surface features, and ongoing exploration potential for signs of life. Jupiter presents a captivating view with its prominent cloud bands, the iconic Great Red Spot, and up to four of its largest moons: Io, Europa, Ganymede, and Callisto.

See the indispensable Observer's Handbook, from the Royal Astronomical Society of Canada. Visit Stellarium-Web for precise views from your location. Almanac: Bright visible planets (rise and set times for your location). Visit TheSkyLive for precise views from your location.
